

A. Semi-Structured Interview Protocol

Purpose

This interview is part of an exploratory study investigating how software and Requirements experience real-time agentic support for generating a Vision Document during live team meetings. The findings contribute to the understanding of human-centric AI-native software engineering and the evolving role of human oversight in agentic RE workflows.

Interview Duration

Approximately 60 minutes, conducted after the participant's final meeting. Structured as follows. Introduction and background: 5 to 10 minutes. Questions on the participant's experience across all meetings they conducted: 40 to 60 minutes.

Interview Format

Online via MS Teams or in person. Conducted individually depending on participant availability. Audio recorded with consent and transcribed for analysis.

Section 0: Background and Context

Purpose: To understand the participant's professional background, experience with requirements work, familiarity with AI tools before engaging with the system, and the extent of their engagement with the system across the study.

1. Could you briefly introduce yourself and describe your current role and experience?
2. How does your team currently handle requirements documentation after a meeting?
3. *What did you expect from an AI system joining a live requirements meeting before you experienced this today?*

Section 1: Vision Document Quality

Purpose: To explore how practitioners perceive the completeness, accuracy, and usefulness of the generated Vision Document.

1. Looking at the Vision Document the system produced, how well does it reflect what your team actually discussed during the meeting?

2. If you were handing this document to a developer or a stakeholder tomorrow, what would you need to change first?
3. The system can carry context from previous meetings into the current session. Did that continuity feel valuable, or did it create confusion? (optional)
- 4: What things surprised you most and what things you want to improve ?

Section 2: Acceptance and Trust

Purpose: To understand how practitioners experience the fit of the system to their requirements work, what shapes their acceptance of agentic support, and how trust develops in relation to the generated output. T

Task fit

1. Thinking about how your team currently produces requirements documentation, where does this system fit naturally into that work, and where does it sit awkwardly?

Performance expectancy

2. The coordinator agent proactively identified missing sections and asked follow-up questions during the meeting. Did that feel like genuine help or an interruption to your discussion?

Effort expectancy

3. How natural did it feel to have the system running while also having a real conversation with your team?
4. *Where do you feel the system is currently trustworthy enough to act on, and where do you feel it is not?*

Section 3: Human and AI Collaboration

Purpose: To explore how practitioners experience working alongside an active agent during a meeting and where human judgment feels essential. Also To invite forward-looking reflection on the human-AI boundary in requirements work.

1. How did it feel to have an AI agent actively participating in the meeting rather than just passively listening?
2. When the coordinator updated sections of the Vision Document based on your responses, did it feel like a collaborative partner or more like an automated process?

3. What do you see as the essential human role in a meeting where agents are doing most of the documentation work?

4. In your view, how far are we from a point where trust in such a system would be calibrated well enough to reduce the need for human oversight on Vision Document generation?

5: What do you think human should do and what things agents do?

6. Which parts of requirements of work do you think could eventually be handled by AI, and which will always need human judgment?

Section 4: Recommendations and Closing

Purpose: To gather practical suggestions for improving the system and close with a final reflection.

1. What is the one thing you would change or add to make this system genuinely useful in your real work?

Other key points or discussion emerged from it.
